Statements and Declarations

Funding. No funding was received for conducting this study.

Competing interests. The author has no competing interests to declare that are relevant to the content of this article.

Ethics approval. Not applicable. The study uses only aggregated public use statistics and involves no human participants, their data or biological material.

Author contributions. The author is the sole author and carried out all of the work reported.

Use of generative AI. The author used a generative AI assistant during preparation of this manuscript, for drafting and editing prose and formatting the reference list, and for some of the simulation code. This goes beyond AI assisted copy editing and is declared for that reason. All theoretical results and their proofs, the design of the empirical analysis, and the interpretation of all findings are the author's own. The author has verified every reported number against the output files named in the notes to the tables and takes full responsibility for the content.

Data, material and code availability. Every series used is a public use file. The two constructed panels, the code that builds them, the simulation scripts and the output file behind every number reported in the paper are at `https://github.com/opxie1/what-pre-trends-cannot-see`, at the tagged release `v1.2`, which is immutable. Both panels rebuild offline from the cached source files under `data/raw/`. The simulations are written in Python and need version 3.11 or later with `numpy`, `scipy` and `pandas`. They draw pseudorandom numbers from the NumPy PCG64 generator, seeded once per replication by the CRC-32 checksum of a string naming the design cell and the replication index, so that any cell can be regenerated on its own. Producing every output file cited in the paper takes 61.2 minutes in total.
